SUPPLEMENT TO REPORT NO. 50X1-HUM

THIS DOCUMENT CONTAINS INFORMATION AFFECTING THE NATIONAL DEFENSE OF THE UNITED STATES, WITHIN THE MEANING OF TITLE 18, SECTIONS 793 AND 794, OF THE U. S. CODE, AS AMENDED. ITS TRANSMISSION OR REVELATION OF ITS CONTENTS TO OR RECEIPT BY AN UNAUTHORIZED PERSON IS PROHIBITED BY LAW. THE REPRODUCTION OF THIS FORM IS PROHIBITED.

THIS IS UNEVALUATED INFORMATION

50X1-HUM

Contents:

1. Population rise for work
2. Commitment to Armed Forces and LVD
3. Employment in agriculture and forestry✓
4. Employment in industry and administration✓
 - a. Public supply, mining, industry and handicraft
 - b. Commerce and traffic
 - c. Public service and private services
5. Employment according to occupational category and sex.

Population Fit for Work

Regarding the development of the total population in relation to a respective territory, the following figures (in millions) are available:

CONFIDENTIAL

50X1-HUM

CENTRAL INTELLIGENCE AGENCY

50X1-HUM

	total number	men	women
1926	147.03	71.05	75.98
1939*	170.47	81.67	88.8
1940	190.48	91.36	99.12
1947	<u>180.16</u>	83.69	96.47

* Not including the newly-acquired districts.

By continuing the figures for 1947, the following status of population will presumably be reached by 1950 (figures in millions)

	total number	men	women
	<u>191</u>	88	103

The percentage of people fit for employment (age ranging from 15 to 65) was as follows (in millions):

	total number	men	women
1926	85.38	40.84	45.54
1939	97.20	46.58	50.62
1947	112.27	50.39	61.88

The percentage of the ages of people fit for earning their living rose from 59 percent in 1926 to 62 percent in 1947, despite the serious war losses; this is due to the maturing of the large age-groups since 1930. This applies not only to the female part of the population, but also to the number of males; the percentage of the latter in the age-groups fit for work rose from 55.5 percent to 60 percent.

The age-groups fit for work, estimated by continuing the previous figures, will be as follows by 1950 (in millions):

	total number	men	women
	<u>120.8</u>	53.6	67.2

For actual employment (commitment to work) the following groups must be deducted:

~~SECRET~~/CONTROL - US OFFICIALS ONLY

-2-

CONFIDENTIAL

~~SECRET~~/CONTROL - US OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

50X1-HUM

Juveniles attending elementary schools, technical schools and high schools.

Disabled and similar persons

People temporarily or permanently ill

Deceitful persons and pensioners

Convict and non-working political or criminal prisoners.

2 The number of pupils must be taken as 1.8 percent of the total number of male juveniles and 2.6 percent of female juveniles according to previous key figures. The schooling program for juvenile workers for mining, industry and transportation provides for the training of 4.5 million juvenile workers in the frame of the Five Year Plan. Its figures rose from 0.5 million in 1946 to 0.8 million in 1947, to 1.0 million in 1948 and to as much as 1.2 millions in 1950. For 1950, another 0.8 million juveniles attending vocational schools (0.6 million in 1947) must be added to the above figure.

The figure for high school students may be estimated at not less than 0.65 million for 1950, the prewar figure was 0.55 million and the average figure for the Five Year Plan was fixed at 0.6 million.

3 According to the previous relative figure for the vocational and trade schools in the Soviet Union, there were 55 percent male pupils and 45 percent female pupils and for universities 35 percent male and 35 percent female students.

The percentage of invalids among the wage-earners group of the German population in Germany was 0.8 percent as early as prewar times; of this figure 82 percent were men, 18 percent women (for the SU a different ratio of percentage for the two sexes must be assumed, viz., 55 : 45). On this basis the ratio of invalids in the total number of wage-earners amounts to 0.98 million for the SU in 1950. However, this figure is too low since, as far back as 1947, the number of unemployed, in other words, war invalids unfit for work, in the SU was stated to be as much as 0.7 million. Disabled and similar persons, however, also include a comparatively large number of industrial or other professional invalids, persons injured in accidents and physically incapacitated women.

According to corresponding German statistics, the percentage of hospitalized persons unfit for earning their living due to sickness (acute and chronic diseases) is 0.9 percent of the age groups normally considered as fit for work. Despite the fact that the public health service in the SU is a great deal below that in Germany, and that the number of hospitalized people who do not come into question for work is comparatively lower, it must be taken for granted that at least two thirds of the German percentage may be reckoned with. The result would be a total of around 0.7 million of hospitalized people, the ratio being

~~SECRET~~/CONTROL/US OFFICIALS ONLY

CONFIDENTIAL

~~SECRET/CONTROL - US OFFICIALS ONLY~~

CENTRAL INTELLIGENCE AGENCY

50X1-HUM

Probably 50 : 50 men and women. Prior to the war, the percentage of recipients of old-age pensions, people of private means and recipients of unemployment relief belonging to the age groups of from 15 to 65 years and no longer fit for work, was 0.7 percent in Germany. Taking into consideration the reactions of the war on the physical fitness of the people in general and the reckless exploitation of labor in the SU, it may be taken for granted that the percentage there is at least 50 percent higher; in other words, that about 1 percent (50 to 50 men to women) of the able-bodied age groups must be deducted as being unfit for work before reaching the age limit of 65 years.

The number of convicts and camp inmates who are not committed to work in the SU can hardly be correctly estimated. Any comparison with the respective figures in Germany (viz., 1.1 percent of the total population, of which only one third are not engaged in work) - would be entirely misleading. For completeness' sake the number of such convicts who are not committed to fatigues details - two thirds men, one third women - in the SU may be roughly estimated at 0.5 million.

As a result, the following numbers must be deducted from the total of number of the able-bodied age groups as being unfit for employment (in millions):

	total	men	women
Pupils (school-children)	2.71	0.96	1.75
Pupils of factory, vocational and trade schools	2.0	1.0	0.9
College students	0.65	0.43	0.22
Disabled and similar persons	1.68	1.20	0.48
Infirm unfit for work	0.7	0.35	0.35
Amputationally unfit people	1.17	0.58	0.59
Non-working convicts	0.5	0.34	0.16
total	9.41	4.96	4.45

As a result, the remainder of persons in the age groups of from 15 to 65 years of age and fit for work in 1950 will probably be as follows in millions:

~~SECRET/CONTROL/US OFFICIALS ONLY~~

CONFIDENTIAL

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

total	men	women
111.35	48.63	62.72

IICommitment to Armed Forces and LVD/MGB Units

The number of persons fit for military service (age 19 to 49 years) and presently under arms is estimated as follows in millions:

Army	2.9
Air Force	0.65
Navy	0.35
LVD/MGB units	0.4

total	4.3
-------	-----

The number of women serving with the Armed Forces, roughly estimated, amounts to between 150,000 to 200,000 (in World War II - 2.85 millions).

The number of men serving with the Armed Forces and the para-military units of the LVD/MGB will therefore be about 4.1 millions in 1950.

Thus, the following numbers of persons remaining for commitment to work (in millions):

total	men	women
107.05	44.53	62.52

IIICommitment to Agriculture and Forestry

The number of persons employed in farming and forestry (agriculture, stock-raising, vegetable farming and gardening, fishing and game-keeping, forestry and lumbering) were as follows (in millions):

~~SECRET/CONTROL/US OFFICIALS ONLY~~**CONFIDENTIAL**

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

	total	men	women	percent women
1926	71.23	36.17	35.56	49.6
1932	72.16	35.96	36.2	50.2
1937	71.55	34.95	36.6	51.1
1944	68.51	33.04	35.47	51.8

in connection the following is to be noted:

a. The gradual fall after 1932 of the total number of employed persons despite the total production of farming and forestry.

b. The continuously rising percentage of female workers after 1926.

Feature "a" is due to the most remarkable intensification and mechanization of agricultural and forestry cultivation and the respective methods of operation.

This also refers to the continuous expansion of engine and tractor stations, the increasing employment of agricultural machines; also to an extended training and the steadily rising number of technical personnel fit for the respective jobs (car-, tractor- and combine drivers, engineers, technical brigade foremen, agronomists etc), the electrification and mechanization in the stock-raising and forestry activities, with the result that, in the period from 1926 to the outbreak of the war, daily work done by human labor amounting to an aggregate figure of 9.1 million per year could be saved. Another result of this development is the yearly increasing number of managing and technical personnel and specialized laborers, while there is a considerable decrease comparatively in the employment of collective farmers and their assisting family members. On the other hand, the rise of the percentage of women is due to the fact that the increased mechanization allows of the employment of women to a much higher degree as the heaviest part of the working process is now done by machines.

The total number of women was only 49.6 percent in 1926 and at the close of the war as high as 51.8 percent. In comparison, the prewar percentage of women in Germany was 55.1 percent. The total requirement of labor for agriculture and forestry, according to the target of the planning for 1950, had been calculated as follows (in millions):

CONFIDENTIAL~~SECRET~~/CONTROL/NO OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

	1950	1937
Persons in independent and leading positions	0.87	0.64
Employees and officials	3.3	1.76
Workmen	11.49	3.65
Collective farmers and assisting family members	52.65	65.5
total	68.31	71.55

The comparison to 1937 clearly shows the extraordinary increase in the number of agricultural officials, employees, specialists and workers as against the 20-percent fall of the collective farmers and their assisting family members. (This is also in accordance with the training program for agricultural specialists according to which not less than 2.3 million farming and forestry specialists and 2 million agronomists, engineers and other experts had to be trained within 5 years.)

The division into male and female labor may be correctly estimated at 30 percent women in the categories of employees and officials, 40 percent in labor and 60 to 65 percent in collective farmers and aiding family members. The percentage of women employed in independent and leading positions is so low that it can be neglected.

Thus the division into sexes of the total number of persons employed in farming and forestry would be as follows (in millions):

total	men	women
68.31	29.75	38.56

The percentage of women would be about 56.5 percent in this case. Thus, the remainder for all other kind of employment would be (in millions):

total	men	women
38.74	14.78	23.96

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

IV

Employment in Industry and Administration

Employment in industry and administration, in the sense of commitment to work according to Soviet terminology, is defined as the whole of employment other than in agriculture and forestry; i.e. employment in one of the general categories such as public supply, mining, industry and handicraft, commerce and traffic, and in public service and private services including the liberal professions.

Apart from the armed units, agriculture and forestry, the total numbers of employed persons were as follows (in millions):

1926	18.99
1932	25.31
1937	29.92
1941	31.83
1944	33.71

For 1950 a total figure of 36.39 millions was calculated on the basis that the target of the plan was reached in every respect.

a. Public supply, mining, industry and handicraft:

The aggregate number of persons employed in these lines may be estimated for 1950 as follows (in millions):

	Approximate figures for	
	1950	1944
Public supply	0.43	0.36
Mining	1.23	1.04
Stones and earths, glass and ceramics	0.77	0.65
Iron and metals	0.74	0.68
Engine, general apparatus, steel buildings	1.22	2.0
Shipbuilding, construction of vehicles	0.7	0.65

~~SECRET/CONTROL/US OFFICIALS ONLY~~**CONFIDENTIAL**

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

Approximate figures for		
	1950	1944
Electrical engineering, precision mechanics and optical instruments	0.99	0.71
Iron, steel, sheet and other metals	0.22	0.2
Armament manufacture	0.95	2.92
Chemical articles	1.09	0.87
Textiles and clothing	2.09	1.9
Leather and leather articles	0.48	0.35
Cellulose, paper and printing material	0.27	0.3
Wood fashioning and wood manufacturing	1.7	1.6
Food and luxuries industry	1.38	1.0
Construction industry and affiliated lines	4.3	4.5
total	18.56	19.83

The development of the total number of persons employed in public supply, mining, industry and handicraft in previous years was as follows (in millions):

1926	7.51
1932	13.59
1937	15.29

The chief increase fell in the public supply services, mining, engineering, shipbuilding and construction of vehicles, electro-technical engineering and precision instruments, chemical products, textile, clothing and leather industries and the building trade.

The target figures for 1950, which are below the figures calculated for 1944 in this case, as compared to the considerable increase in the number of persons employed in all the other manufacturing lines, are mostly due to the decline of the number of persons employed in the armament industry which dropped to a little less than

~~SECRET/CONTROL/US OFFICIALS ONLY~~

CONFIDENTIAL

~~SECRET/CONTROL - US OFFICIALS ONLY~~

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

one third, and those engaged in the engineering and steel building which decreased to a little less than two thirds.

Moreover, certain forces of the building trades and affiliated lines were meanwhile released as toward the close of the war no less than approximately 1.5 million persons had been employed in clearing debris, putting in order the ruined places and preparing them for reconstruction operations.

The decline in engineering and steel construction is essentially due to the elimination of sub-contracting supplies and repairs to war material as well as new construction and repair work in the fields of steel building, bridge building, locomotive and railroad car building.

It is difficult to estimate for 1950 the percentage of women employed in public supply work, mining, industry and handicraft.

In 1926, in the early stage of the industrialization in the Soviet Union, this percentage was 32.8 percent in the last year of the war it had reached 60.1 percent.

The last mentioned percentage is only conceivable and tenable under war conditions. It represents a most questionable makeshift enforced by the enormous needs for reserves by the Soviet Army which made itself felt in a most disturbing manner, especially in the industry field by a drop of output, non-fulfillment of the prescribed quotas and ever-increasing amount of waste.

Taking into account the higher percentage of women generally employed in both industry and administration, at least 50 percent (the percentage of women in mining and heavy industry sometimes being as much as two or three times that figure), the following percentage figures of women calculated on the basis of the composition of the categories of employed people in the western industrial countries in percent is reached:

CONFIDENTIAL

~~SECRET/CONTROL/US OFFICIALS ONLY~~

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

Public supplies	24
Lining	28
Stones and earths, glass and ceramic	51
Iron and metals	21
Engine, boiler and general apparatus buildings	31
Shipbuilding, construction of vehicles	36
Electrical engineering, precision mechanics and optical instrument, Iron, steel, sheet and other metals	42
Armament manufacture	40
Chemical articles	38
Textiles and clothing, leather and footwear	78
Cellulose, paper and newsprint	52
Wood fashioning and wood manufacturing	29
Food and luxuries industry	54
Building trade and affiliated lines	39

Thus, the total number of industrial labor would be divided between men and women as follows (in millions):

<u>total</u>	<u>men</u>	<u>women</u>
18.56	10.55	8.01

The percentage of employed women amounts to 43 percent. For the remaining lines of employment a total number of 20.18 million persons will be available, viz., 4.23 men and about 15.95 million women.

b. Commerce and traffic

The trend of development of the figures covering all persons employed in commerce and traffic was as follows (in millions):

CONFIDENTIAL~~SECRET~~/CONTROL/NO OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

1928 2.45

1932 5.63

1937 6.08

1944 6.98

For 1950 the total employment figures are calculated as follows (in millions):

	Calculated figures	
	1950	1944
Food and luxuries	0.7	0.65
+ 0.26 aiding fam- ily mem- bers		
Commercial trade	2.09	
+ 0.21 "		1.7
Publishing trade, advertising trade, real estate	0.17	0.1
Money transactions, banking and insurance trade	0.27	0.2
Mail and telegraph service	0.54	0.38
Railroads	2.26	2.11
Automotive traffic, for- warding trade, storing trade	1.12	1.0
Ocean, coastwise and inland navigation	0.13	0.12
Restaurant and hotel trade	0.69	
+ 0.24 "		0.27
total	8.68	6.98
of which	0.71	about 1 million aiding family members.

~~SECRET~~/CONTROL/US OFFICIALS ONLY

-12-

CONFIDENTIAL

~~SECRET/CONTROL~~ - US OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

50X1-HUM

The considerable increase in the total numbers of persons employed in commerce and traffic as compared with previous years is due chiefly to the rising production volume in the commercial and agricultural fields which entailed an increased movement of goods in transportation, storing and turnover and the extension of rail, water and road-traffic. Another result is an expansion in the restaurant and hotel trade and in commerce in relation to the growth of the population.

The percentage of female labor in 1926 was only 15 percent, an abnormally low figure. During the last year of the war it rose to 63 percent which, for the above reasons, is untenable and abnormally high.

In Germany the respective prewar percentage was 35 percent.

The following percentage of women employed in commerce and traffic are obtained on the basis of the usual percentage of employment of women plus an increase of at least 30 percent over the normal average of women and which must be applied in view of the conditions in the Soviet Union in percent:

Food and luxuries trade	65
Commercial trade	59
Publishing, advertising and real estate trades	67
Money transactions, banking and insurance trades	42
Mail and telegraph service	38
Railroads	20
Other traffic	22
Restaurant and hotel trade	79

basing conclusions on these percentages and supposing that the so-called aiding family members are females with but a few exceptions, the following division among the sexes employed in commerce and traffic (in millions) is reached:

total number	men	women
8.68	4.49	4.19

~~SECRET/CONTROL/US OFFICIALS ONLY~~

-13-

CONFIDENTIAL

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

After subtracting this category (b), the remainder of available persons is as follows (in millions):

total number	men	women
11.50	0.26	11.76

Male labor of category (b) is not available in sufficient number; part of them must be supplemented by female workers.

c. Public services

The numbers of persons employed in public services (including the liberal professions) were as follows (in millions):

1926	2.03
1927	6.09
1937	8.55
1944	7.0

The decline in the last year of the war is explained by the purely war-conditioned savings in the fields of education, culture and entertainment.

For 1950, the following strengths are calculated to be needed (in millions):

	figure of 1937 for comparison *	
Government administration	2.73	2.06
Communal administration	1.25	0.88
Educational and cultural service	3.2	2.24
Public health and hygiene	1.64	1.12
Entertainment, stage, screen and music	0.33	0.21
total	9.15	6.51

* These figures do not include persons in independent and leading positions.

The percentage of women in the whole of this category rose from 38 percent in 1926 to 42 percent in 1937; the prewar figure in Germany was 31 percent. Considering that the employment of women in the Soviet Union was, as a rule, at least 30 percent higher than the

~~SECRET~~/CONTROL/US OFFICIALS ONLY

-14-

CONFIDENTIAL

~~SECRET/CONTROL~~ - US OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

50X1-HUM

normal average, one gets the following figures for the requirements of persons employed in public services for 1950 (in percent):

Government and communal administration	38
Educational and cultural services	42
Public health and hygiene	78
Entertainment, stage and screen, music	52

The aggregate number of persons employed in this category would be divided among men and women as follows (in millions):

total	men	women
9.15	4.82	4.33

This means a total of approximately 48 percent female labor.

In this case, also one sees that, taking into account the technique commitment to work, it is not possible to classify male and female labor according to the respective percentages needed for fulfilling the plan as it is not even possible to meet the full requirement of males for the Armed Forces and MVD, farming and forestry, industry and handicraft, commerce and traffic. This would also be the case if the need for public services were disregarded.

Thus, after deducting category c, we get the following table:

total	men	women
11.50	- 0.26	11.76
- 9.15	- 4.82	- 4.33
+ 2.35	- 5.08	+ 7.43
		- 5.08
		+ 2.35

It is, therefore, impossible to regulate the employment of males in such a manner as would be necessary within the frame of the Five Years Plan on the basis of the usual proportion of the sexes in the various categories of employed persons. There is a shortage of 5.1 million able-bodied male labor who must be substituted by females.

~~SECRET/CONTROL~~ - US OFFICIALS ONLY

-15-

CONFIDENTIAL

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

A surplus of 2.35 million able-bodied women results from the calculation of the total figures.

V

Employment According to Occupational Categories and Sexes

A summary of the above figures applied to the planning target for 1950 - apart from the people under arms or undergoing occupational or other training - results in the following requirement of labor forces (in millions):

	total	men	women
Farming and forestry	68.31	29.75	38.56
Mining, industry and handicraft	18.56	10.55	8.01
Commerce and traffic	8.68	4.49	4.19
Public services	9.15	4.82	4.33
	104.70	49.61	55.09

The percentage of male labor for the total requirement is thus 47.5 percent, that of female labor 52.5 percent. The corresponding prewar figures in Germany were 62.5 male wage-earners, 37.5 female wage-earners.

After deduction from the age groups fit for work unfit persons and those serving with the armed forces the following total numbers of persons are available for employment (in millions):

total	men	women
107.22	55.20	62.02

Despite the lower percentage of needed male labor (nearly one-quarter), the number required for work cannot be secured in the Soviet Union for 1950. On the contrary, there is a shortage of 5.08 million men. If they are replaced by women there remains a surplus of 2.35 million able-bodied women.

The result is as follows:

a. Theoretically speaking, the planning targets for 1950 can be met by the available number of people.

~~SECRET~~/CONTROL/US OFFICIALS ONLY

-16-

CONFIDENTIAL

CENTRAL INTELLIGENCE AGENCY
CONFIDENTIAL

50X1-HUM

b. However, difficulties may arise in any of the lines of production which are short of the needed number of male workers (work requiring technical skill along with heavy physical work).

c. As a result the Soviet Union will probably try and fill the gaps by compulsory engagement and displacement of foreign labor. Foreign experts and specialist workers in particular will be employed in key positions.

d. In all places where female labor can be employed in lieu of male workers, female labor must be engaged far beyond the usual percentage (farming, food industry, commerce, money banking and insurance business, restaurant and hotel trades, educational and cultural institutions, public health service and entertainment).

e. Unavoidable cancellations in the programs for 1950, if any, will be mostly effected wherever male labor can be saved without impairing the reconstruction work, the volume of production and all other technical and mechanical targets, i.e. in the field of the cooperative plan (cooperative industries and distribution, cultural problems).

f. The final result would be that savings could only be achieved at the cost of the feeding of the large masses.

Dividing into categories the number of workers needed for 1950 we obtain the following result (in millions):

	total	Farming and Forestry	Industry and handicraft	Commerce and Traffic	Public Services
Leading and independent positions	3.58	0.87	0.83	0.75	1.13
Employees and officials	14.75	3.3	2.19	3.12	6.14
Workmen	33.01	11.49	15.54	4.10	1.88
Collective farmers and assisting family members	53.36	52.65	-	0.71	-
total	104.7	68.31	18.56	8.68	9.15

CONFIDENTIAL~~SECRET~~/CONTROL/US OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

CONFIDENTIAL

50X1-HUM

The different composition of the working population in the Soviet Union and Germany is shown in the following confrontation (in percent):

	<u>Soviet Union</u>		<u>Germany *</u>
Persons employed in leading or independent positions	3	Independent persons **	14
Employees and officials	13	Officials	5
Workmen	32	Employees	13
Collective farmers and assisting family members	17 25	Workmen	51
		Aiding family members	17

* Original part of Germany, Austria, Sudetenland, 1939

** 7 percent of this aggregate percentage of independent persons are engaged in farming.

The above two columns cannot be compared directly, as in the Soviet Union part of the persons counted as officials and employees in Germany are included in the category of persons in leading positions, and peasants and farmers (7 percent) under "independent persons" belong to the collective farmers category in the Soviet Union. The division of the total amount of working persons required for 1950 into categories of trades and professions shows that the balance of employment cannot meet the requirements. Toward the close of the war about 2.5 million people held independent or leading positions. The plan provides for the additional training by 1950 of about 0.6 million of specialists intended for leading positions. Even if it is fulfilled, there will be only about 3.3 million, which is a shortage of one half-million for 1949. The number of workmen (labor), which was 30.4 million in 1940, dropped to 25.8 million by the close of the war.

The plan provides for the training of 4.5 million juvenile workers and 3.2 other specialist workers (total of 7.7 millions). If the plan target is reached, 33.5 million workers should be available by the close of 1950, which is as much as one half-million more than will be required in that year. By 1947, however, the total number of workmen had only risen to 31.6 millions. Taking as a basis a minimum training period of 2 years to become a fully efficient worker, the number of workmen would, at best, reach 32.7 millions by the beginning of next year, even considering the present training target of 1.1 million.

50X1-HUM

For technical employees the plan provides for the training of 1.33 million specialists, and for commercial employees a training figure of 0.6 to 0.8 million. Even if it was possible to reach the target of this training plan by a schooling period of 2 to 3 years these figures would not ensure over 14 million employees.

A considerable shortage of employees and labor makes itself felt especially in the industrial and administrative fields (excluding farming and industry). Their total number was around 27 million people at the close of the war. According to Soviet statements the yearly increase in the number of labor and employees in industry and administration reaches a maximum of 1.21 million. This would mean that, at most, 31 million will be available by 1950 whereas about 33 millions are needed.

The result, in the category "collective farmers and assisting family members" is that all female workers, without exception, must be committed to work and none of them can remain unemployed or do only household work.

In contrast, the number of women who only looked after their household amounted to as much as 6 million.

The total figure of 2.35 million non-wage earning women cannot possibly be valued as "surplus" but is only a sign of the utterly strained situation in the labor market.

1. Statistical Yearbook 1940/41

Total population, 1926: 147.03 millions, of which 71.05 males, 75.98 females.

Of which wage-earners: 84.36 millions, of which 45.22 males, 39.14 females.

Percentage of wage-earners of total population, 57.4 percent, among them males 63.6 percent, females 51.5 percent.

Classification of wage-earners in 1926, subdivided into occupational categories:

	total number	men	women
Armed Forces	0.64	0.64	-
Farming and forestry, fishing	71.73	36.17	35.76
Industry and mining	7.51	5.05	2.46
Commerce and trade	2.45	2.09	0.36
Public services and liberal professions	2.03	1.26	0.76
	84.36		

Total population in 1939, excluding newly-acquired districts: 170.47 millions, of which 81.67 males, 88.8 females.

Total population in 1939, including newly acquired districts (Baltic States, Eastern Poland, Bessarabia): 190.48 millions.

2. Institute for Market Research: The USSR in Figures, 1939

Numbers of workers and employees in the most important economical branches

	in millions	1932	1937
Mining and industry		8.0	10.11
Building trade		2.84	2.02
Railroads		1.3	1.51
Waterways		0.15	0.18
Other means of communication		0.6	1.09
Mail service		0.22	0.38
Commerce		1.41	1.99
Loans and credits (money and banks)		0.13	0.19
Education, arts		1.44	2.42
Public health		0.65	1.12
State administration		1.83	1.74
Communal administration		0.39	0.75
Restaurants and hotels and other non-agricultural lines		0.94	0.74
Farming		2.86	2.48
Forestry		0.2	0.25
		22.96	26.99

The number of people employed in the wholesale industry alone rose from 2.7 millions in 1926 to 7.4 millions in 1937.

5. Press service of the Austro-Soviet Society (O.S.O.V.), No 6/1948

The total population of the SU has reached 193 millions; the number of people entitled to vote is 101.72 millions.

6. Pravda, 28 May 1948

In the years 1946 to 1947, the number of laborers increased by about 4.2 million. In the first three months of 1948 it exceeded the figure of the corresponding season of the preceding year by 2 millions. The number of urban population rose from 26 millions to 61 millions in the period from 1926 to 1940.

7. 21 June 1947

In the middle of 1947, about 27 million workers were employed in industry and administration, 5 millions less than in 1941.

Attachment 1

The Five-Year Plan provides, among other things, for the training of 5.4 million specialists workers for mining, industry, traffic and transportation, 2.3 million for agriculture and 13.9 millions for other occupations.

8. Monthly Labour Review/November 1947

The five-years plan for 1946 to 1950 provides for the training of 4.5 million juvenile workers and, irrespective of age, a total number of 7.7 million adult workers.

By late 1950, 33.5 million workers will be employed as compared to 31.3 million, planned for late 1947. In 1940, their number was 30.4 million. The training or schooling program for labor reserves reached 3.25 million juvenile workers for the industry within the five-year plan of the war, 1940 to 1945. The yearly training program provides for an increase from 0.79 million in 1947 to as much as 1.2 millions in 1950. By 1947 over 3 million juvenile workers had finished their training according to the plan within the frame of the postwar five-year plan.

9. Neue Welt (New World) No 21/1947

From 1926 to 1939 the population in the SU increased by 16 percent; the number of skilled mechanics had risen 3.7 times; turners 6.8 times, that of milling cutters 13 times, engine-drivers 4.4 times, tractor drivers 215 times, engineers 7.7 times, agronomists 5 times, scientists 7.1 times, teachers 3.5 times, doctors 2.3 times.

10. Pravda, 15 February 1948

The training plan for 1948 provides for the training of 1.1 million juvenile workers, among which are 0.62 million for coal mining, 0.2 for the building trade, 0.1 for metallurgy, 0.07 for traffic, 0.05 million for the textile industry.

11. Radio Moscow, 8 September 1947

The number of unemployed people reached 2.12 millions, excluding short-workers. 1.4 millions worked less than 14 hours per week, 6 millions 15 to 34 hours. 0.7 million war invalids were unemployed.

12. TASS, 14 October 1947

The number of workers and employees in industry and administration increased by about 1.25 millions per year.

13. Sovietskoye Slovo (The Soviet Word), 7 March 1948

The number of female leading employees, engineers and technicians, employed in the industry, transportation and the building trade reached 0.25 million.

During the war about 1 million females were employed in railroad traffic.

CONFIDENTIAL~~SECRET~~/CONTROL/US OFFICIALS ONLY

~~CONFIDENTIAL~~~~SECRET/CONTROL - US OFFICIALS ONLY~~

CENTRAL INTELLIGENCE AGENCY

Attachment 1

14. Trud (Labor), 16 June 1948

In the course of the present Five Year Plan 0.6 million college-trained specialists and 1.33 million high school graduates will be available.

15. Sovetskoye Slovo, 26 July 1946

In 1947, 1.8 million pupils will be trained in trade schools, railroad and factory schools, which is 0.6 million more than in 1946.

The schools of the Ministry of Labor reserves will issue 0.8 million qualified workers by 1947.

16. Pravda (The Truth), 16 July 1948

In 1947, 0.8 million skilled juvenile workers were placed at the disposal of the industry and this figure will be raised to over 1 million in 1948.

17. Agriculture in the Soviet Union according to the 1947 Five Year Plan

For the entire field of agriculture, an increase of production by 27 percent, as compared to 1940, has been fixed for the end of the 1946/1950 Five Year Period of the plan.

Taking as a basis the gross production of agriculture in 1932 - 100, the index figure for 1937 is 153, the index figure for 1940 is 177, and the index figure 255 will be reached in 1950.

At the same time the cultivated acreage will be extended by 45 million ha. in the course of the Five Year Period of the plan.

The 100 percent increase in grain production during that period shall be attained by increasing the productiveness to as much as 65 percent and by expanding the cultivated area by 35 percent.

In 1943 a top-fit collective farmer cultivated and harvested 4.2 ha on an average, whereas in 1926 an individual farmer could only do the same work for 2.2 ha.

In 1937, the amount of work done by the tractors corresponded to 221 million human working days, i.e., 1.9 million workers per year; if the same amount of work was to be achieved with draft animals and by hand it would require 9.1 million workers per year, i.e., 7.2 millions more.

From 1932 to 1942, the MTS trained about 4 million men, among others 2.6 million tractor drivers, 550,000 combine drivers, 225,000 car drivers and 145,000 brigade leaders.

The electrification of the working processes, as compared with manual work yields the following saving of work:

~~SECRET-CONTROL/US OFFICIALS ONLY~~

CENTRAL INTELLIGENCE AGENCY

Attachment 1

with threshing, 30 percent, grinding 30 percent, cultivation of vegetables 20 percent, milking 30 percent, sheep-shearing 50 percent, irrigation 75 percent and with preparation of food 60 percent.

In 1941 each collective unit counted 820 animals (cattle and other) on an average; in 1945: 1,460.

The mechanization of stock-farming not only raises the productivity of the animals, but also reduces the required number of workers. On mechanized farms one female milker can service up to 27 cows, in the nonmechanized ones, only 10 to 12.

18. Report of the ZSU (Tsentralnoye Sovetskoye Udarenye - Central Soviet Administration) on the results of the fulfillment of the plan in the second quarter of 1949:

Number of Workmen and Employees
(in million persons)

1 January 1948	31.4	1 January 1949	33.4
1 April 1948	32.0	1 April 1949	33.4
1 July 1948	32.3	1 July 1949	33.9
1 October 1948	32.9		

Annotation

1. For 1944, the last year of the war, the corresponding figures of the reports of the "Armed Forces War Staff-East" were taken as a basis.
2. The figures of the able-bodied population for 1947 and 1950 are gathered from the latest computations of this office.
3. "Juveniles" are defined as minors over 15 years of age.

Requirement of Labor of the Soviet Union for 1950 for Fulfilling the Plan Targets

Preliminary remark concerning the methodic principle:

The calculation of the requirements has been made independently of the previous development of commitment to work in the Soviet Union.

The various categories of employment have been subdivided beyond the usual Soviet classification to be in accordance with the systematics of trade (classification of wage earners according to the various lines of economy).

As far as possible - especially in the economy of production - definite head quotas were compiled to serve as a basis for the calculation of the total requirement of employed persons excluding self-employed persons and those in leading positions. In the agricultural line the cultivated acreage and livestock-keeping as fixed by the plan has been taken as a basis.

In the forestry and lumber trade, public supply, mining and industry the respective lines of production were based on the characteristic main produce, including the by-products to the usual ratio.

For manufacturing groups of widely split production processes the total output values (gross production) were taken as a basis. In cases where it was not possible to find out the latter values, their relation to the total output to the German standard has been taken as the basic value.

where it was not possible to ascertain the head quotas on the basis of previous Soviet production figures or employment figures, the corresponding German values plus about 30 percent were taken as a basis, as the German working capacity per head is superior to the Soviet output by at least that quota percentage.

As a basis for transportation and traffic figures the following values were taken: For railroad traffic the length of the railroad net, for motor traffic the number of motor vehicles, for shipping the total tonnage.

For the other lines of trade and employment, percentage additions were made in accordance with the plan targets (increase in output) as compared to the prewar period. Accordingly, the following additions were made to the various categories in the sense of the plan, viz., so and so many percents in excess of the prewar production in each case (for 1950):

Total production	48 percent
Food and luxuries	27 percent
Restaurants and hotels,)	
Administration	17 percent

~~CONFIDENTIAL~~~~SECRET/CONTROL/US OFFICIALS ONLY~~

~~SECRET~~/CONTROL - US OFFICIALS ONLY

CENTRAL INTELLIGENCE AGENCY

Attachment 3

The latter figure is derived from the fact that the total number of population in 1950 will be about 17 percent above the prewar status. The subdivision of the employed, according to their classification as wage receivers or salary receivers (workmen or employees and officials), was made on the ratios (percentages) of Soviet statistics and similar classification figures in Germany.

The number of self-employed bread-winners and people in leading positions was also estimated on the basis of the German prewar conditions and of previous Soviet figures on persons employed in leading positions ("Soviet intelligentsia").

	Plan target 1950	quotas per head and year (workmen and em- ployees)	work- men in mil- lions	Emple- ment in mil- lions	Self- employ- ed and officials per- sons in lead- ing po- sitions in millions	Total in millions
